

User Churn Project | Preliminary Data Summary

Prepared for: Waze Leadership Team

OVERVIEW

The Waze data team's objective is to develop an analytical model that can help prevent user churn on the Waze app and can generate valuable insights that can help the leadership team make informed business decisions.

This report provides preliminary data summary, information on the project status and key insights which impact the future development of the overall project.

PROJECT STATUS

- ✓ Initial data inspection was done to understand the relationship between variables.
- ✓ A data frame was built for the churn data, each row represents ride details and columns represent ride attributes.
- ✓ Statistical summary was collected

IMPACT: The team determined the relationship between variables that will guide further analysis of the data.

NEXT STEPS

- More exploration of data is needed in terms of Super Drivers. It's possible that the reason they are driving so much is also the reason why the Waze app does not meet their specific set of needs, which may differ from typical drivers.
- The next step is to further explore EDA and draw visualizations so as to get narrative behind the data and guide future project decisions.

KEY INSIGHTS

- The dataset contains **82% retained** users and **18% churned** users.
- The dataset contains 12 unique variables containing float, int, and object type data. The label column contains **700 missing** values with no indication of random omission.
- Churned user drives average ~3 more than retained users.
- Retained users used the app over twice as many days as churned users in the last month.
- Churned users drove ~200 km and 2.5 hr. more than the retained users **EACH DAY in LAST MONTH.**
- Churned users had more drives in fewer days, and their trips were farther and longer in duration. This is bound to the user, still, more exploration is needed.
- The median per day drive of churned users is 350% more than that of retained users. This shows the possibility of long-haul truckers. The dataset consists of Super drivers.
- Regardless of user churn, the users represented in this data drive a lot! It is probably safe to assume that this data does not represent typical drivers at large.
